Gmelin's test is a chemical test used for detecting the presence of bile pigments in urine. It is named after Leopold Gmelin, who introduced the test. Five millilitres of urine is slowly added to five millilitres of concentrated nitric acid in a test-tube. Different coloured rings between the two layers are visible if bile pigments are present as they are oxidised to various chemical products.

The falciform ligament, visible on the front of the liver, divides the liver into a left and a much larger right lobe. From the underside, the two additional lobes are located between the right and left lobes. A line can be imagined running from the left of the vena cava and all the way forward to divide the liver and gallbladder into two halves. ...
