very high cycle fatigue (VHCF) failure at over 107 cycles. This disappearance of fatigue limits causes fatigue failures even in the gigacycle region, i.e., above 109 cycles. We therefore call this phenomenon 'gigacycle fatigue'. Figures 1 and 2 show typical fatigue test results for conventional and high strength steels, respectively [1,2].

However, the fatigue life of current automobile engines ranges around 108 cycles; big diesel engines for ships or high speed trains have ranges to 109 cycles. It is further noted that at this time interest in fatigue life extends to about 1010 cycles, for example, in turbine engine components (Figure 1.1).
