Handbook Of Geostationary Orbits Space

This Handbook Of Geostationary Orbits is in principle an extension of the Introduction to Geostationary Orbits that was printed as a special publication by the European Space Agency (ESA) in 1983. The immediate purpose was to provide the theoretical background and some practical advice for the orbit control of geostationary spacecraft by means of the software package "PEPSOC".

Handbook of Geostationary Orbits - E.M. Soop - Google Books

The Handbook of Geostationary Orbits is based on sixteen years' experience in controlling the orbits of about fifteen geostationary satellites. It provides the necessary theoretical and practical background for engineers and spacecraft operators, but it can also be used as an introductory textbook in space courses at high school or university.

The continuing development and the increasing use of the geostationary orbit has now created the need for a new, more detailed publication to include new aspects that have emerged. The present Handbook contains several additional subjects and more mathematics to describe the methods applied in PEPSOC.

Space debris at geostationary orbits typically has a lower collision speed than at LEO since all GEO satellites orbit in the same plane, altitude and speed; however, the presence of satellites in eccentric orbits allows for collisions at up to 4 km/s. Although a collision is comparatively unlikely, GEO satellites have a limited ability to avoid any debris.
