## Hhmi Star Genetics Fruit Fly

StarGenetics simulates genetic experiments using known model organisms such as Mendel's garden peas, flies (*Drosophila melanogaster*), and yeast (*Saccharomyces cerevisiae*). StarGenetics simulate crosses in cows, which can be use to explore traits in organisms with similar genetics to humans.

The fruit fly may provide a simple model in which to learn about blood-cell formation. Researchers have discovered a gene in the fruit fly that aids survival of developing blood cells. Because the gene shows striking conservation with a corresponding gene family in mammals, including humans, the scientists speculate that the fruit fly may provide a far simpler model in which to study blood ...

In fruit fly experiments, available variation in traits includes eye color, body color, wing length, wing vein, antennae length, sterility, and lethality. Yeast genetics experiment simulations enable mating, tetrad analysis, and replica plating onto various media and lawns of cells.

What was once thought to be a done-and-dusted map of the fruit fly brain has gotten a second look, and researchers have discovered that it's actually not done at all. Two teams of scientists at the Janelia Research Campus have independently mapped a brain region critical for memory and learning in the fruit fly, *Drosophila melanogaster*, in the larval and adult life stages.

Many scientists complain that the current funding situation is dire. Indeed, there has been an overall decline in support in funding for research from the National Institutes of Health and the National Science Foundation. Eight Nobel Prizes have been awarded for fruit fly research that has led to advances in molecular biology, genetics, and neuroscience. An important advantage of flies is their size: Drosophila brains are relatively small (one hundred thousand neurons) compared to, for example, a mouse brain (one hundred million neurons) or a human brain (one hundred billion neurons).
