The Law of Sines

In trigonometry, the law of cosines (also known as the cosine formula, cosine rule, or al-Kashi's theorem) relates the lengths of the sides of a triangle to the cosine of one of its angles. Using notation as in Fig. 1, the law of cosines states where γ denotes the angle contained between sides...

The Law of Cosines (also called the Cosine Rule) says: $c^2 = a^2 + b^2 - 2ab \cos(C)$ It helps us solve some triangles. Let's see how to use it.

Law Of Sines And Cosines

Law of Sines. Just look at it. You can always immediately look at a triangle and tell whether or not you can use the Law of Sines. You need either 2 sides and the non-included angle or, in this case, 2 angles and the non-included side. The law of sines is all about opposite pairs.

The law of sines and law of cosines are two different equations relating the measure of the angles of a triangle to the length of the sides. The laws apply to any triangle, not just right-angled triangles. Draw a triangle. Label the angles A, B and C and the opposite sides a, b and c. The law of sines says that the sines of the angles are ...

Proof of the Law of Cosines - Math Open Reference

Once you've mastered the concepts of sine and cosine, you can use them as building blocks for other useful tools in trigonometry. For example, the "law of cosines" is a special formula that helps you find the missing side or missing angle of a triangle.

The Law of Cosines

The Law of Sines (or Sine Rule) is very useful for solving triangles: $a \sin A = b \sin B = c \sin C$. It works for any triangle: a, b and c are sides. A, B and C are angles. (Side a faces angle A, side b faces angle B and. side c faces angle C).

Word Problems Using Law of Sines and Cosines

The Law of Cosines has three sides and one angle, so that doesn't fit the problem. What we want is the Law of Sines. That's the ticket. Let's put our values in there: Now let's move some things around and get calculating: We're not done yet, though, we need to apply some inverse sine to both sides to get to B itself. $B = \sin^{-1}(0.860)$ $B = 59.4^\circ$

Law of Sines and Cosines--When to use each formula, video ...

But from the equation $c \sin B = b \sin C$, we can easily get the law of sines: The law of cosines. There are two other versions of the law of cosines, $a^2 = b^2 + c^2 - 2bc \cos A$ and $b^2 = a^2 + c^2 - 2ac \cos B$. Since the three versions differ only in the labelling of the triangle, it is enough to verify one just one of them.
