Visual Acuity Tests - Lea-Test Ltd.

Lea Hyvärinen, MD, PhD, has created numerous vision assessment and screening products since designing her LEA SYMBOLS® (apple, house, circle, square) in 1976. Over time, individualized eye chart variations using LEA SYMBOLS® were created for various vision screening programs.

Lea test - Wikipedia

The chart gives high sensitivity for measuring visual acuity in both childhood (age 4 and above) with early and reliable detection of amblyopia. Previous studies have found that in older children, visual acuity assessment using LEA symbols' is 0.5 to 2 lines better than non-logMAR Landolt C charts or with Bailey-Lovie logMAR letter charts.

Is LEA symbol better compared to Snellen chart for visual

...

Therefore, these symbols might be useful for early detection of amblyopia. We evaluated whether the visual acuity determined with Lea symbols (LS) corresponds to the visual acuity determined with the Landolt-C (LC). · Patients and methods: In 55 strabismic amblyopic volunteers aged 5–59 years, the monocular visual acuity of both eyes was ...

Lea Symbols Visual Acuity Assessment

Among the array of visual assessment picture tests that exist, the LEA symbols tests are the only tests that have been calibrated against the standardized Landolt C vision test symbol. The Landolt C is an optotype that is used throughout most of the world as the standardized symbol for measuring visual acuity.

Results: Mean visual acuity was higher (i.e., lower logarithm of the minimum angle of resolution) with the Lea symbols crowded using flanking optotypes, equivalent to about 1.5 optotype difference.

Examination of young children with Lea symbols

Screening programs and tests for assessment using LEA SYMBOLS® are also a part of computer based tests by: M&S Technologies, INC P.O.Box 1171 Park Ridge, IL 60068, U.S.A. FAX +1-773-467 0816 jmarino@mstec.com. For more information, see the Instructions Section: LEA SYMBOLS® Visual Acuity Tests.

assessment in early childhood. Significant variability of visual acuity in this age group is caused by cooperation. When monocular measurements are possible on both eyes, however, the intraindividual interocular difference of visual acuity usually does not exceed one line.

LEA SYMBOLS DOMINO CARDS (251500) - Vision 2020 LVRC

In older children and adults, there appears to be a high correlation between visual acuity measurements made using the Lea symbols chart and those made using a Bailey-Lovie chart; however, overall visual acuity measurements obtained with the Lea symbol chart were approximately one line (0.09 ± 0.11 logMAR) better than those obtained with the Bailey-Lovie chart. 99 Similar results are seen ...

RESULTS Mean visual acuity was higher (i.e., lower logarithm of the minimum angle of resolution) with the Lea symbols crowded using flanking optotypes, equivalent to about 1.5 optotype difference. Visual acuity measured with the two charts was significantly correlated; however, the 95% limits of agreement were larger than expected from repeatability studies using Lea symbols.

Lea symbols: Visual acuity assessment and detection of

...

CONCLUSIONS Lea symbols with flanking optotypes resulted in higher visual acuity than the Lea symbols with flanking bars, probably as a result of differences in the crowding effect. The two charts showed insufficient agreement, and we do not recommend their use interchangeably.

At low levels, the acuity values using various optotypes can differ significantly from the visual acuity as measured by the Landolt C. Particularly in amblyopic eyes, letters are easier to recognise than a Landolt C of the corresponding size. 14 Fortunately, there is only a little difference between Lea symbol acuity and the Landolt C acuity even in strabismus amblyopia 15 and Lea symbols ...

The measurement of visual acuity in children: an evidence ...

Purpose: The aim of this study was to assess the feasibility of a visual acuity (VA) test using the Lea Symbols 15-line folding distance chart and its diagnostic validity in detecting VA deficiency in preschool children. Methods: A group of 149 children aged 38–54 months underwent VA examination performed with the Lea 15-line folding optotype at a distance of 3 metres, according to a ...
