A solar thermal collector collects heat by absorbing sunlight. The term "solar collector" commonly refers to a device for solar hot water heating, but may refer to large power generating installations

such as solar parabolic troughs and solar towers or non water heating devices such as solar air heaters.

Solar thermal collectors are either non-concentrating or concentrating. In non-concentrating collectors, the aperture area is roughly the same as the absorber area. This type has no extra parts

solar energy to a working fluid, such as water or air. The solar heat can be used for heating water, to back up heating systems, or for heating swimming pools. The heart of a solar collector is the absorber, which is usually composed of several narrow metal strips.

solar collector

Solar collectors come in a set of standard sizing of 10, 20, 22 or 30, depending on your region. Of course you can also combine collectors to increase the size. If you get an answer that is not a standard size, as a general rule, select the next size down - this
