I have so many difficult in solving problem in General Topology of John Kelley and Topology (second edition) of James R. Munkres. Does anyone know solution book of those? Just want to ask so many p...

~~Section 26: Compact Spaces | dbFin~~

Connectedness is a topological property: any two homeomorphic topological spaces are either both connected, or both disconnected, and the same set can be connected in one topology but disconnected in another, for example, and \mathbb{R} . A space is connected iff the only sets that are both open and closed in it are the whole space and the empty set.

Munkres - Topology - Chapter 4
Solutions Section 30 Problem 30.1.
Solution: Part (a) Suppose X is a nite-countable T_1 space. Let $\{x\}$ be a one-point set in X , which must be closed. Let $\mathcal{B} = \{B_n\}$ be a collection of neighborhoods of x such that every neighborhood of x contains at least one B_n . Clearly $\{x\}$ is contained in every B_n . If $\{x\}$ is open, then some B_n

~~James R. Munkres' TOPOLOGY, 2nd edition: How to check my work?~~
Problem Sets. The problem sets are assigned from the textbook: Munkres, James R. Topology. 2nd ed. Upper Saddle River, NJ: Prentice-Hall, 28 December 1999. ISBN: 0131816292. Problem set 0 is a "diagnostic" problem set. It is designed to determine whether you are comfortable enough with the language of set theory to begin the study of topology.

Munkres - Topology - Chapter 2
Solutions Section 13 Problem 13.1. Let X be a topological space; let A be a subset of X . Suppose that for each $x \in A$ there is an open set U containing x such that $U \cap A$ is open in X . Show that A is open in X . Solution: Let C be the collection of open sets U where $x \in U \cap A$ for some $x \in A$. Suppose $U \cap A = \bigcup_{x \in A} U_x$. Since X is a topological space ...

~~Section 20: Problem 3 Solution | dbFin~~
Section 26: Compact Spaces A compact space is a space such that every open covering of contains a finite covering of \cdot ; If a space is compact in a finer topology then it is compact in a coarser one. If a space is compact in a finer topology and Hausdorff in a coarser one then the topologies are the same.

As an example, consider with the product topology, with the dictionary order topology (the ordered square, I^2), and with the subspace topology inherited from I^2 in the dictionary order topology (the latter is the same as the product topology $I \times I$). Then τ is strictly finer than τ_1 and τ_2 , where the latter two topologies are not comparable.
